employed to further characterize these sera. Five of seven sera that were obtained early p.i. prevented binding of HCV to cells. Preincubation of such sera with HVRL-specific fusion proteins restored binding of HCV to cells in four of five sera. These findings suggest that the majority of neutralizing antibodies are directed against HVRL.

Example 21. Fig 41, 34pp, English.
The present sequence is the variable kappa chain gene segment the present sequence is the variable kappa chain gene segment occitaining human DNA fragment, vk65.3, which was co-injected along with the human DNA fragments vk65.5, vk65.8 and vk65.15 into half day mouse embryo pronuclei, to generate an unrearranged light chain minilocus transgene. The resulting transgenic mice can be used for the production of heterologus (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a human gamma immunoglobulins.
                                                                                                              14-APR-1997 (first entry)

DNA fragment vk65.3, containing variable kappa chain gene.

Variable: kappa chain; gene segment; human; DNA fragment; vk65.3;

unrearranged, light chain; minilocus; transgene, transgenic; mouse;

Production, heterologous; antibody; gamma, immunoglobulin, ss.

Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prodn. of heterologous human immunoglobulin(s) - by immunising

Human DNA fragments vk65.3, vk65.8 and vk65.15 (given in Human DNA fragments vk65.3, vk65.8 and vk65.15 (given in U78852-078955, respectively) each contain a V-kappa acme seament that can be used to form a complete human light chain minilocus transgene for expression in a nonhuman transgenic animal for the veryous antibody production. The deduced amino acid sequences of the V-kappa coding regions are given in R6728-R62931. Sequence 812.8P.

DNA Iragments from Fostil's Flair Clones were subcloned into plasmid vectors. Variable genomics selected on the basis of open reading transes, intext dones were selected on the basis of open reading transes, intext donor and seceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were

The V-kappa specific of group neartish of an as used to prake a human placental genomic ENA library cloned into lambdaEMEL/SPS/T7.

ENA fragments containing V-kappa segments from positive plage clones were subcloned into plasmid vectors. Variable gene segments

The resulting transgenic mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a preselected antigen and collecting antigen binding heterologous Sequence 900 BF; 225 A; 244 C; 204 G; 227 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14-ApR-1997 (first entry)

DNA fragment vk65.5, containing variable kappa chain gene.

DNA fragment; kappa chain; yene segment; human; DNA fragment; vk65.5;

unrearranged; light chain; minilocus; transgene; transgenic; mouse; production; heterologous; antibody; gamma; immunoglobulin; ss.
from the resulting clones were sequenced and functional clones were selected on the basis of open reading frames, intact donor and acceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were designated p55.3, p65.5, p65.8 and p65.15 (see Q44222-Q44225,
                                                                                                                                                                                                                                                                                                                          Gaps

The leader peptide and the L'V region are encoded in different reading frames. The L'V region corresponds to the last three amino acids of the leader peptide and the rearranged VJ gene. Clone 489-VkI5 (see Q11878) encodes an aberrant light chain containing

Actil:Festadomenas aeruginosa type antibody L-chain coding DNA -
contains constant kappa and lambda type regions, and versatile
region recognising paseruginosa F4 and H1 types
Disclosure; Pages 610-511: 12pp; Japanese.

It also codes for a variable region recognising Ps.aeruginosa F4 and H1
types. The Ab can be used for immunologic control of infection caused by
Ps.aeruginosa. The antibody is made effective against various classes or
subclasses of registant Ps.aeruginosa by recombining corresp DNA L-chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           production of human IgG monoclonal antibody - by converting human antibody into other subclasses by genetic engineering antibody into other subclasses by genetic engineering pisclosure; fig. 3: 17pp; Japanese.

Disclosure: fig. 3: 17pp; Japanese.

This encodes a variable chain and can be connected to a gene encoding a constant region which determines optional IgG subclass. This can be used to study subclasses, and as an antigen for prepg. IgGl or IgG3 antibody. Regions 325-372 connected to 560-571 encode the L chain, region 572-856 encodes V chain and region 857-895 encodes J chain. Sequence 1011 BP; 237 A; 263 C; 254 G; 257 T;

This sequence represents the prombs phagemid expression vector. This vector has been designed to allow for anchoring of expressed proteins on vector has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein, for an order in the afor residue minor phage coat protein, cpill (cp3), which is expressed prior to extrusion in the phage assembly process on a bacterial membrane and accumulates on the inner membrane lacoung into the periplism of E. conf. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and lish variable regions which bind to HIV qp120, pcombs allows for both surface display regions which bind to HIV qp120. pcombs allows for both surface display of combinatorial Fab ilbraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of combinatorial Fab libraries. Dicomo consists of a JNA mojecule having of combinatorial Fab libraries. Dicomo consists of a JNA mojecule having two cassettes to express one fusion protein, Fd/Kp3, and one soluble protein, the light chain. The finished vector comprises, operatively protein, the light cassette consisting of lacz promoter/operator linked 5 to 3' to 4 first cassette consisting of lacz promoter/operator sequences, a Notl restriction site, a ribosome binding site (RHS), a sequence, a spacer region, a cloning region bordered by 5' Mhol and pacteriophage cp3 followed by a stop codon, a Nhel restriction site between the two cassettes, and a second lacz promoter/operator sequence, between the two cassettes, and a second lacz promoter/operator sequence, between the two cassettes, and a second lacz promoter/operator sequence, clollowed by an expression control RBS, a PelB leader, a spacer region, a followed by expression control stop sequences and a second Not!
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of the MT4 Fab display phagemid expression vector, pMT4-3 (see also 092540), used in the invention for the production of synthetic human Fab antibodies against 9pl20 of HIV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the expression vector, poho-TT which is a modified version of the phagemid expression vector, pcomb3 given in (92546. pphr-TT provides for the expression vector, pcomb3 given in (92546. pphr-TT provides for the expression vector, pcomb1e Fabs which are secreted into the periplasmic space which is regulated from the alkaline to phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise the variable regions which bind to HIV gpl20. psho-TI consists of a DNA molecule having two cassettes to express two soluble consists of a DNA molecule having two cassettes to express two soluble consists of a DNA molecule having two cassettes to express two soluble consists of a DNA molecule having two cassettes consisting of the phoA concert/operator sequences, an Enski restriction site, a ritosomm of region brondered by S. sact and Y. Xbal restriction for sites, an Nool restriction site between the two cassettes, and a second cassette consisting of an expression control stop sequences and a Notle sequence and a Notle sequences and a Notle statiction site. Asperer region control stop sequences and a Notle castiction site, and a second consisting of an expression control stop sequences and a Notle sequences and a Notle sequences of the phage of the province of the nucleotide sequences of the heavy and light chain stuffer that is 1200 by in length and a heavy cantable domains of a remain to the consistion of a person of the chains of a point of the nucleotide sequences of the heavy and light chain variable domains of a consistion of the consistion of the control of the control of a person of the control of

diversity antibody libraries, for screening antigens
claim 21; Page 84-85; 120pp; English
This sequence represents the light chain coding sequence derived from
This sequence represents the light chain coding sequence derived from
the surface display phagement of the coding sequence derived from
the surface display phagement and heavy and light chain variable
contains the bacteriophage gene III and heavy and light chain variable
domains sequences for encoding human feab antibodies against teranus toxin.
This sequence was pref. used in the method of the invention for the
production of antibody libraries containing increased diversity. The
sequences given in 470480-86 are primers which were used for inducing
mutagenesis in a complementary determining region (CDR) of an
immunoglobulin light chain gene. These primers contain a 3' terminus
capable of hybridising to a irst framework region and a nucleotide
sequence between the 5' and 3' termini having the forming (NNF),
when the CDF regions of immunoglobulins heavy or light chains that
the libraries with increased antibody diversity by inducing mutagenesis
are displayed an the surface of immunoglobulins heavy or light chains that
the library These primers of immunoglobulins heavy or light chain CDR3.

The libraries with increased antibody diversity by inducing mutagenesis
are displayed an the surface of immunoglobulins heavy or light chain CDR3.

The libraries with increased antibody mutagenesis
and libraries with increased antibody diversity by inducing mutagenesis
and displayed an the surface of immunoglobulins heavy or light chain CDR3.

Sequence 645 BP; 18C A; 197 C; 170 G; 127 T;
                                                                                W.04-APR-1995 (first entry)
Anti-terauss toxoid light chain cDNA from vector, pc3AP313.

By using mutagenic ONs an extremely large population of different landomised binding sites can be created and use of the universal light chain increases the number of combinations which yield functional heterodimeric antibodies sequence 646 BP; 162 A; 187 C; 170 G; 127 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 gageteaegeagteteeaggeaeeetgtetttgteteeaggggaaagageeaeeetetee 60
